Frame = in bed (into bed to out of bed). Line = lights out. Black bar = asleep, estimated (lights out + time to fall asleep, to waking for the day). 2× · 45 min = awakenings and time awake. SE = sleep efficiency. N = naps (minutes). C = caffeine (drinks · last one). A = alcohol (drinks · last one). ← → = the sleep goes past the edge of the grid; the exact times are on the night-by-night page. The bars follow the clock, also on the night of a clock change.

Recorded by the person, not measured by a device. SleepSlate is not a medical device. Time asleep = (waking for the day − lights out) − time to fall asleep − awake during the night. Sleep efficiency = time asleep ÷ time in bed (into bed to out of bed) × 100; for a week, average time asleep ÷ average time in bed. Naps are not included.
